Modern Computer Algebra

Addenda and corrigenda for the May 1999 edition

2 February 2004

JOACHIM VON ZUR GATHEN
and
JÜRGEN GERHARD

Universität Paderborn

Page 212 Lemma 8.2 is correct but not general enough to cover its application in Theorem 12.2. If you are interested in that Theorem, you may replace Lemma 8.2 and its proof by:

LEMMA 8.2. *Let $b, c \in \mathbb{R}_{>0}, d \in \mathbb{R}_{\geq 0}, S, T \colon \mathbb{N} \longrightarrow \mathbb{N}$ be functions with $S(2n) \geq cS(n)$ for all $n \in \mathbb{N}$, and*

$$T(1) = d, \quad T(n) \leq bT(n/2) + S(n) \text{ for } n = 2^i \text{ and } i \in \mathbb{N}_{\geq 1}.$$

Then for $i \in \mathbb{N}$ and $n = 2^i$ we have

$$T(n) \leq \begin{cases} dn^{\log b} + S(n) \log n & \text{if } b = c, \\ dn^{\log b} + \frac{c}{b-c} S(n)(n^{\log(b/c)} - 1) & \text{if } b \neq c. \end{cases}$$

In particular, if $n^{\log c} \in O(S(n))$, then $T(n) \in O(S(n) \log n)$ if $b = c$, and $T(n) \in O(S(n)n^{\log(b/c)})$ if $b > c$.

PROOF. Unraveling the recursion, we obtain inductively

$$\begin{aligned} T(2^i) &\leq bT(2^{i-1}) + S(2^i) \leq b(bT(2^{i-2}) + S(2^{i-1})) + S(2^i) \\ &= b^2 T(2^{i-2}) + bS(2^{i-1}) + S(2^i) \leq \cdots \\ &\leq b^i T(1) + \sum_{0 \leq j < i} b^j S(2^{i-j}) \leq d2^{i \log b} + S(2^i) \sum_{0 \leq j < i} \left(\frac{b}{c}\right)^j, \end{aligned}$$

where we have used that $S(2^{i-j}) \leq c^{-j} S(2^i)$ in the last inequality. If $b = c$, then the last sum simplifies to $S(2^i) \cdot i$. If $b \neq c$, then we have a geometric sum

$$\sum_{0 \leq j < i} \left(\frac{b}{c}\right)^j = \frac{(\frac{b}{c})^i - 1}{\frac{b}{c} - 1} = \frac{c}{b-c}(2^{i(\log(b/c))} - 1),$$

and the first claim follows. □

(29. 11. 2003)

$$\sum_{1 \leq i < n} 2i = n^2 - n$$

(HEIKO KÖRNER, 19. 2. 2003)

Page 95 lines 1–5, proof of Theorem 5.1: replace this paragraph by:

arithmetic operations. Then for each i, we divide m by m_i, taking $2n - 2$ operations (Exercise 5.3), evaluate m/m_i at u_i, taking at most $2n - 3$ operations since m/m_i is monic, and divide v_i by that value. This amounts to $4n^2 - 4n$ operations for all i. Finally, computing the linear combination (3) takes another $2n^2 - 2n$ operations, and the estimate follows by adding up.

(HEIKO KÖRNER, 19. 2. 2003)

Page 112 line 14: $t = x/2$, not $t = -x/2$ (HEIKO KÖRNER, 19. 2. 2003)

Page 511   line 14, Exercise 18.18 (i): replace $x/2\ln x$ by $x/(2\ln x)$ (MICHAEL NÜSKEN, 20. 3. 2001)

line –10, Exercise 18.20: replace $\gcd(a, p_i)$ by $\gcd(p, p_i)$ (MICHAEL NÜSKEN, 20. 3. 2001)

Page 456   line 14, Lemma 16.14: $1 < k < i$ instead of $1 \le k < i$ (THOMAS VIEHMANN, 19. 3. 2001)

Page 526   line –10: replace b^2 rem N by *the least absolute residue of b^2 modulo N* (THOMAS VIEHMANN, 19. 3. 2001)

Page 530   line 8: this is the expected number of trials for finding *one B*-number, but we need *h* of them.
(THOMAS VIEHMANN, 19. 3. 2001)
The following 11 lines should be replaced by:
We need $h + 1$ B-numbers, and the expected number k of loop iterations satisfies $k \le n^{2r}(h+1)$. Plugging this into (4) and using $n < h < B$, we obtain a total cost of

$$O(B^3 + B^2 n^{2r} \mathsf{M}(n)) \tag{7}$$

word operations. Ignoring the factor $\mathsf{M}(n)$ and equating the logarithms of the two factors $B^2 = e^{n/r}$ and $n^{2r} = e^{2r\ln n}$ gives $r^2 \approx n/(2\ln n)$, and we set

$$r = \left\lceil \sqrt{\frac{n}{2\ln n}} \right\rceil . \tag{8}$$

Then $B \le e^{\sqrt{n(\ln n)/2}}$, and using

$$L(N) = e^{\sqrt{\ln N \ln \ln N}}, \tag{9}$$

we obtain the following result by substituting (8) in (7).

━━ THEOREM 19.15. ━━

Dixon's random squares method factors an integer N with an expected number of $O^\sim(L(N)^{2\sqrt{2}})$ word operations. ━━

Page 533   line 9: insert *and $v = ru + s$* before the closing curly brace (THOMAS VIEHMANN, 19. 3. 2001)

Page 457   line –6: replace this line by

$$D_0 = \|f_1^*\|^{2(n-1)} \|f_2^*\|^{2(n-2)} \cdots \|f_{n-1}^*\|^2 \leq \|f_1\|^{2(n-1)} \|f_2\|^{2(n-2)} \cdots \|f_{n-1}\|^2 \leq A^{n(n-1)},$$

(EVA MIERENDORFF, 17. 3. 2001)

Page 494   line –18: remove "or a Carmichael number". The Fermat test may return "composite" for Carmichael numbers, namely when $\gcd(a,N) > 1$. (EVA MIERENDORFF, 17. 3. 2001)

Page 539   lines 11–14, Theorem 19.24: the additional condition $\#S \geq 3$ is needed, and the constant c is independent of p and S (EVA MIERENDORFF, 17. 3. 2001)

     lines –5 to –1, Corollary 19.25: the additional condition $\sigma \geq 3$ is needed, and the constant c_1 is independent of p, N, and B (EVA MIERENDORFF, 17. 3. 2001)

Page 628   line 11: $\log_{2^{64}} n$ instead of $\log_{2^64} n$ (16. 3. 2001)

Page 540   lines 5–7: replace these lines by

$$\left(1 - \frac{M}{N^3}\right)^m \leq \left(1 - \frac{sc_1}{\ln p}\right)^m \leq \left(1 - \frac{sc_1}{\ln C}\right)^m \leq e^{-msc_1/\ln C} \leq \varepsilon,$$

when we choose $m \geq \ln(1/\varepsilon)\ln(C)/(sc_1)$, *where c_1 is as in the previous corollary.* (THOMAS VIEHMANN, 11. 3. 2001)

Page 550   line –9: replace "nonconstant polynomials $g,h \in F[x]$" by *polynomials $g,h \in F[x]$ of degree at least* 2 (THOMAS VIEHMANN, 11. 3. 2001)

Page 575   lines –7 and –6, proof of Lemma 21.15: replace this sentence by *There is at least one term $q_i x^{\alpha_i}$ in which x^β occurs, and then $x^{\alpha_i} \mid x^\beta$.* (THOMAS VIEHMANN, 11. 3. 2001)

Page 585   lines –9 and –8: a $g^{**} \in G$ such that $\mathrm{lt}(g^{**}) \mid \mathrm{lt}(g^*)$. *Since G is minimal, we have* $\mathrm{lt}(g) = \mathrm{lt}(g^*) = \mathrm{lt}(g^{**}) \in \mathrm{lt}(G^*), \ldots$ (THOMAS VIEHMANN, 11. 3. 2001)

Page 472   line –12, Exercise 16.7: The definition of the Hermite normal form is wrong. In addition to being lower triangular, the Hermite normal form is required to have positive diagonal entries, and the entries below the diagonal must be reduced modulo the diagonal element in the same column. These additional assumptions make the Hermite normal form of a nonsingular square matrix with integer entries unique. Algorithm 16.26 only computes a lower triangular

matrix, but not necessarily the Hermite normal form. However, it is easy to compute the Hermite normal form from any lower triangular matrix: multiply some rows by -1 to make all diagonal elements positive if necessary, and then reduce the elements below the diagonal modulo the diagonal element in each column. (4. 2. 2001)

Page 473 line 2, step 5 of Algorithm 16.26: *row index* instead of column index (4. 2. 2001)

Page 637 line –13, Exercise 23.14: $f \sim g$ instead of $f \equiv g$ (4. 2. 2001)

Page 194 line 3, Exercise 6.45 (iii): insert *if f, g are in $\mathbb{Z}[x]$ with max-norms at most A* at the end of the sentence (25. 8. 2000)

Page 495 line –3: replace "algorithms" by *algorithm* (FRIEDRICH EISENBRAND, 16. 8. 2000)

Page 496 lines 15–19: The argument that $0 \notin I$ can be simplified by noting that $(-1)^m = -1 \neq 1$ (FRIEDRICH EISENBRAND, 16. 8. 2000)

Page 237 line 10, Exercise 8.9 (ii): replace DFT_ω^{-1} by $\text{DFT}_{\omega^{-1}}$ (MICHAEL NÖCKER, 9. 6. 2000)

Page 132 line –17: replace $\mathbb{Q}$ by $\mathbb{Q} \setminus \{0\}$

line –15: replace $b_i \in \mathbb{N}_{\geq 1}$ by $b \in \mathbb{N}_{\geq 1}$, and $\gcd(a_0, \dots, a_n) = 1$ by $\gcd(a_0, \dots, a_n, b) = 1$

(DANIEL LAUER, 22. 5. 2000)

Page 176 line 5, Theorem 6.55: Replace $0 \leq i \leq \ell$ by $2 \leq i \leq \ell$. Moreover, the definition of subresultants and the proof of the theorem have to be modified so that $\deg f < \deg g$ is allowed and the kth subresultant is defined for $k < \deg f$ or $k < \deg g$ as well, similarly to Lemma 6.25. (DANIEL LAUER, 22. 5. 2000)

Page 192 line –16, Exercise 6.36 (i): replace $\mathbb{Q}[y]$ by $\mathbb{Q}[x]$ (DANIEL LAUER, 22. 5. 2000)

Page 194   line –4, Exercise 6.49 (ii): the sentence should read: *Prove that both the numerator and the denominator of α_i are absolutely at most $(2B)^i$*. (DANIEL LAUER, 22. 5. 2000)

Page 121   line –11: replace $g_{i,2}$ by $g_{i,2}^*$ (OLAF MÜLLER, 15. 5. 2000)

Page 42   line –3, quote by Augustus de Morgan: *writers* instead of "writings" (16. 4. 2000)

Page 216   line –2: $b \cdot (\omega^g - 1)$ instead of $b \cdot (w^g - 1)$ (16. 4. 2000)

Page 735   line 31, Index, left column: the correct Greek spelling of Euclid's name is Εὐκλείδης (16. 4. 2000)

Page 639   lines –9 and –8, Exercise 23.29 (iii): Replace nonconstant by *nonzero*. Moreover, it is not true that this representation is unique. For example, for $a = x$ and $b = x^2 - 1$, both $(r,s,u,v) = (1, x+1, 1, x-1)$ and $(r,s,u,v) = (1, x-1, x, 1)$ satisfy the conditions.

line –4, Exercise 23.29 (iv): Both implications are wrong. A counterexample for the "if" direction is $a = x+1$ and $b = x$, where in fact $(r,s,u,v) = (1,1,1,x)$ is the unique resspentation as in (iii), but there do not exist polynomials c, d such that $\Delta(c/d) = a/b = 1 + 1/x$, by Lemma 23.5. A counterexample for the "only if" part is $a = 2x+1$ and $b = 1$, where $(r,s,u,v) = (2x+1, 1, 1, 1)$ is the unique representation as in (iii), and for $c = x^2$ and $d = 1$ we have $\Delta(c/d) = a/b$.

However, the following is true: there exist nonzero coprime monic polynomials $c, d \in F[x]$ such that $E(c/d) = a/b$ if and only if $r = s = 1$ for all representations as in (iii), and in fact $(r,s,u,v) = (1,1,d,c)$ is the unique resspentation in this case (see S. A. ABRAMOV and M. PETKOVŠEK (2001), Canonical Representations of Hypergeometric Terms, *Formal Power Series and Algebraic Combinatorics (FPSAC01)*, to appear.)

line –2, Exercise 23.29 (v): replace "the extended" by *an extended*

Page 361   line 15, step 1 of Algorithm 14.8: **if** $a \in \mathbb{F}_q$ instead of **if** $a \in F$ (HELMUT MEYN, 29. 5. 1999)

Page 374   line –17: $a_{n-1}, \ldots, a_0$ instead of $a_{n-1}, \ldots, 0$ (HELMUT MEYN, 29. 5. 1999)

Page 517   line 5: the factored number is $2^{599} - 1$ (PAUL ZIMMERMANN, 27. 5. 1999)

Page 543   line –23: Exercise 19.1 is about the 159-digit factor N of $2^{599} - 1$, from page 517 (PAUL ZIMMERMANN, 27. 5. 1999)

Page 91   Figure 5.3: the arrow pointing down left and marked "lifting" should be replaced by a vertical down arrow "modular computation $R/\langle p \rangle \longrightarrow R/\langle p \rangle$" plus a horizontal arrow "lifting $R/\langle p^l \rangle \longleftarrow R/\langle p \rangle$" (MICHAEL CLAUSEN, 25. 5. 1999)

Page 101   lines –8 through –4: insert *The entries $a_{ij}^{(1)} = a_{ij}$ are the entries of the original matrix A.* The inequality on line –7 should read "$|a_{ij}| \le b_1$", the formula on line –5 becomes

$$b_k \le 2b_{k-1}^4 \le 2^{1+4}b_{k-2}^{4^2} \le \cdots \le 2^{1+4+\cdots+4^{k-2}}b_1^{4^{k-1}} = 2^{(4^{k-1}-1)/3}b_1^{4^{k-1}},$$

and the formula on line –4 should read "$n^2 \lambda(b_1) \approx n^2 \log_{2^{64}} b_1$". (MICHAEL CLAUSEN, 25. 5. 1999)

Page 305   line 2: replace the bound by $(10\mathsf{M}(n) + O(n))\log n$ (25. 5. 1999)

Page 451   line 8: The formula in the proof of Theorem 16.6 should read:

$$\left| \det \begin{pmatrix} f_1 \\ \vdots \\ f_n \end{pmatrix} \right| = \left| \det \begin{pmatrix} f_1^* \\ \vdots \\ f_n^* \end{pmatrix} \right| = \|f_1^*\| \cdots \|f_n^*\| \le \|f_1\| \cdots \|f_n\|.$$

(MICHAEL CLAUSEN, 25. 5. 1999)

Page 750   line 12, Index, left column: Shokrollahi, *Mohammad* Amin (MICHAEL CLAUSEN, 25. 5. 1999)

Page 128   line 24, Exercise 5.35: The f as required is a (one-dimensional) cubic spline, not a Bézier curve. A two-dimensional cubic spline, for example, interpolating a set of points $(x_0, y_0), \ldots, (x_n, y_n) \in \mathbb{R}^2$, is obtained by applying the exercise twice, once with with $u_i = i$ and $v_i = x_i$ for all i, and once with $u_i = i$ and $v_i = y_i$ for all i. This yields a parametric curve $(x(t), y(t))$ for $0 \le t \le n$ such that for each $i \in \{0, \ldots, n-1\}$, $x(t)$ and $y(t)$ are fixed cubic polynomials in t on the interval $[i, i+1]$. We can rewrite these two polynomials as a Bézier curve

$$\begin{aligned} (x(t), y(t)) = (x_i, y_i) \cdot (i+1-t)^3 + P_i \cdot 3(t-i)(i+1-t)^2 \\ + Q_i \cdot 3(t-i)^2(i+1-t) + (x_{i+1}, y_{i+1}) \cdot (t-i)^3 \end{aligned}$$

on the interval $[i, i+1]$, where $P_i, Q_i \in \mathbb{R}^2$ are **control points**. In this form, $(x(t), y(t))$ is a (cubic) Bézier spline interpolating $(x_0, y_0), \ldots, (x_n, y_n)$ and with control points $P_0, Q_0, \ldots, P_{n-1}, Q_{n-1}$. (20. 5. 1999)
