Part II

Context–Free Languages

Outline

Introductory Example I

Example 1

Syntax definition of programming languages by "Backus Naur" rules
Here: simple arithmetic expressions

$$
\begin{array}{rcl}
\langle \mathit{Expression} \rangle & ::= & 0 \\
& | & 1 \\
& | & \langle \mathit{Expression} \rangle + \langle \mathit{Expression} \rangle \\
& | & \langle \mathit{Expression} \rangle * \langle \mathit{Expression} \rangle \\
& | & (\langle \mathit{Expression} \rangle)
\end{array}
$$

Meaning:

> *An expression is either 0 or 1, or it is of the form* $u + v$, $u * v$, *or* (u) *where* u, v *are again expressions*

Example 2 (continued)

Here we abbreviate $\langle \mathit{Expression} \rangle$ as E, and use $\rightarrow$ instead of ::=. Thus:

$$E \quad \rightarrow \quad 0 \mid 1 \mid E + E \mid E * E \mid (E)$$

Now expressions can be generated by applying rules to the start symbol E:

$$\begin{aligned} E &\Rightarrow E * E \\ &\Rightarrow (E) * E \\ &\Rightarrow (E) * 1 \\ &\Rightarrow (E + E) * 1 \\ &\Rightarrow (0 + E) * 1 \\ &\Rightarrow (0 + 1) * 1 \end{aligned}$$

Context–Free Grammars I

Definition 3

A context–free grammar (CFG) is a quadruple

$$G = \langle N, \Sigma, P, S \rangle$$

where

- N is a finite set of nonterminal symbols
- Σ is the (finite) alphabet of terminal symbols (disjoint from N)
- P is a finite set of production rules of the form $A \to \alpha$ where $A \in N$ and $\alpha \in (N \cup \Sigma)^*$
- $S \in N$ is a start symbol

Context–Free Grammars II

Example 4

For the above example, we have:

- $N = \{E\}$
- $\Sigma = \{0, 1, +, *, (,)\}$
- $P = \{E \to 0, E \to 1, E \to E + E, E \to E * E, E \to (E)\}$

Due to our naming conventions, it usually suffices to specify a grammar by giving its productions (and the start symbol—usually the symbol on the RHS of the first production).

Definition 5

Let $G = \langle N, \Sigma, P, S \rangle$ be a CFG.

- A sentence $\gamma \in (N \cup \Sigma)^*$ is directly derivable from $\beta \in (N \cup \Sigma)^*$ if there exist $\pi = A \to \alpha \in P$ and $\delta_1, \delta_2 \in (N \cup \Sigma)^*$ such that $\beta = \delta_1 A \delta_2$ and $\gamma = \delta_1 \alpha \delta_2$ (notation: $\beta \overset{\pi}{\Rightarrow} \gamma$ or just $\beta \Rightarrow \gamma$) .
- A derivation (of length n) of γ from β is a sequence of direct derivations of the form $\delta_0 \Rightarrow \delta_1 \Rightarrow \ldots \Rightarrow \delta_n$ where $\delta_0 = \beta$, $\delta_n = \gamma$, and $\delta_{i-1} \Rightarrow \delta_i$ for every $1 \leq i \leq n$ (notation: $\beta \Rightarrow^* \gamma$).
- A word $w \in \Sigma^*$ is called derivable in G if $S \Rightarrow^* w$.
- The language generated by G is $L(G) := \{w \in \Sigma^* \mid S \Rightarrow^* w\}$.
- A language $L \subseteq \Sigma^*$ is called context–free (CFL) if it is generated by some CFG.
- Two grammars G_1, G_2 are equivalent if $L(G_1) = L(G_2)$.

Context–Free Languages II

Example 6

The language $\{a^n b^n \mid n \in \mathbb{N}\}$ is context–free (but not regular—see previous part). It is generated by the grammar $G = \langle N, \Sigma, P, S \rangle$ with

- $N = \{S\}$
- $\Sigma = \{a, b\}$
- $P = \{S \to aSb \mid \varepsilon\}$

(proof: by induction on n; on board)

Context–Free Languages II

Example 6

The language $\{a^n b^n \mid n \in \mathbb{N}\}$ is context–free (but not regular—see previous part). It is generated by the grammar $G = \langle N, \Sigma, P, S \rangle$ with

- $N = \{S\}$
- $\Sigma = \{a, b\}$
- $P = \{S \to aSb \mid \varepsilon\}$

(proof: by induction on n; on board)

Remark: illustration of derivations by derivation trees

- root labeled by start symbol
- leafs labeled by terminal symbols
- successors of node labeled according to right–hand side of production rule

(example on board)

Outline

Context–Free and Regular Languages

Theorem 7

1. *Every regular language is context–free.*
2. *There exist CFLs which are not regular.*

(In other words: the class of regular languages is a proper subset of the class of CFLs.)

Context–Free and Regular Languages

Theorem 7

1. *Every regular language is context–free.*
2. *There exist CFLs which are not regular.*

(In other words: the class of regular languages is a proper subset of the class of CFLs.)

Proof.

1. Let L be a regular language, and let $\mathfrak{A} = \langle Q, \Sigma, \delta, q_0, F \rangle$ be a DFA which recognizes L. $G := \langle N, \Sigma, P, S \rangle$ is defined as follows:
   - $N := Q$, $S := q_0$
   - if $\delta(q, a) = q'$, then $q \to aq' \in P$
   - if $q \in F$, then $q \to \varepsilon \in P$

   Obviously a w–labeled run in $\mathfrak{A}$ from q_0 to F corresponds to a derivation of w in G, and vice versa. Thus $L(\mathfrak{A}) = L(G)$ (example on board).
2. An example is $\{a^n b^n \mid n \in \mathbb{N}\}$.

Open:

- Decidability of word problem

Outline

The Word Problem

- **Goal:** given $G = \langle N, \Sigma, P, S \rangle$ and $w \in \Sigma^*$, decide whether $w \in L(G)$ or not
- For regular languages this was easy: just let the corresponding DFA run on w.
- But here: how to decide when to stop a derivation?
- **Solution:** establish normal form for grammars which guarantees that each nonterminal produces at least one terminal symbol

$\Longrightarrow$ only finitely many combinations

Chomsky Normal Form I

Definition 8

A CFG is in Chomsky normal form (Chomsky NF) if every of its productions is of the form

$$A \to BC \quad \text{or} \quad A \to a$$

(and maybe $S \to \varepsilon$, in which case S does not occur on the right–hand side of any production).

Chomsky Normal Form I

Definition 8

A CFG is in Chomsky normal form (Chomsky NF) if every of its productions is of the form

$$A \to BC \quad \text{or} \quad A \to a$$

(and maybe $S \to \varepsilon$, in which case S does not occur on the right–hand side of any production).

Example 9

Let $S \to aSb \mid \varepsilon$ be the known grammar which generates $L := \{a^n b^n \mid n \in \mathbb{N}\}$. An equivalent grammar in Chomsky NF is

$$\begin{array}{ll} S \to \varepsilon \mid AC & \text{(generates } L\text{)} \\ A \to a & \text{(generates } \{a\}\text{)} \\ B \to b & \text{(generates } \{b\}\text{)} \\ C \to DB & \text{(generates } \{a^n b^{n+1} \mid n \in \mathbb{N}\}\text{)} \\ D \to AC \mid \varepsilon & \text{(generates } L\text{)} \end{array}$$

Chomsky Normal Form II

Theorem 10

Every CFL is generatable by a CFG in Chomsky NF.

Chomsky Normal Form II

Theorem 10

Every CFL is generatable by a CFG in Chomsky NF.

Proof.

Let L be a CFL, and let $G = \langle N, \Sigma, P, S \rangle$ be some CFG which generates L. The transformation of P into rules of the form $A \to BC$ and $A \to a$ proceeds in three steps:

1. terminal symbols only in rules of the form $A \to a$
   (thus all other rules have the shape $A \to A_1 \dots A_n$)
2. elimination of rules of the form $A \to B$
3. elimination of rules of the form $A \to A_1 \dots A_n$ where $n > 2$

□

Chomsky Normal Form III

continued.

Step 1: (only $A \to a$)

1. let $N' := \{B_a \mid a \in \Sigma\}$
2. let $P' := \{A \to \alpha' \mid A \to \alpha \in P\} \cup \{B_a \to a \mid a \in \Sigma\}$
   where $\alpha' := \alpha[a \mapsto B_a \mid a \in \Sigma]$

This yields G' (example: on board)

Chomsky Normal Form III

continued.

Step 1: (only $A \to a$)

1. let $N' := \{B_a \mid a \in \Sigma\}$
2. let $P' := \{A \to \alpha' \mid A \to \alpha \in P\} \cup \{B_a \to a \mid a \in \Sigma\}$ where $\alpha' := \alpha[a \mapsto B_a \mid a \in \Sigma]$

This yields G' (example: on board)

Step 2: (elimination of $A \to B$)

1. determine all derivations $A_1 \Rightarrow \ldots \Rightarrow A_n$ with rules of the form $A \to B$ without repetition of nonterminals ($\Longrightarrow$ only finitely many!)
2. let $P'' := (P \cup \{A_1 \to \alpha \mid A_1 \Rightarrow \ldots \Rightarrow A_n \Rightarrow \alpha, \alpha \notin N\}) \setminus \{A \to B \mid A \to B \in P'\}$

This yields G'' (example: on board)

Chomsky Normal Form IV

continued.

Step 3: for every $A \to A_1 \dots A_n$ with $n > 2$:

1. add new symbols $B_1, \dots, B_{n-2}$ to N''
2. replace $A \to A_1 \dots A_n$ by

$$\begin{aligned} A &\to A_1 B_1 \\ B_1 &\to A_2 B_2 \\ &\vdots \\ B_{n-3} &\to A_{n-2} B_{n-2} \\ B_{n-2} &\to A_{n-1} A_n \end{aligned}$$

This yields G''' (example: on board)

One can show: G, G', G'', G''' are equivalent □

The Word Problem Revisited

Goal: given $G = \langle N, \Sigma, P, S \rangle$ and $w \in \Sigma^*$, decide if $w \in L(G)$ or not

Approach by Cocke, Younger, Kasami (CYK algorithm):

1. assume G in Chomsky NF
2. let $w = a_1 \dots a_n$
3. if $n = 0$, then the word problem is trivial (since G in Chomsky NF)
4. otherwise let $w[i, j] := a_i \dots a_j$ for every $1 \leq i \leq j \leq n$
5. consider segments $w[i, j]$ in order of increasing length, starting with $w[i, i]$ (i.e., single letters)
6. in each case, determine $N_{i,j} := \{A \in N \mid A \Rightarrow^* w[i, j]\}$
7. test whether $S \in N_{1,n}$ (and thus, whether $S \Rightarrow^* w[1, n] = w$)

The CYK Algorithm I

Algorithm

Input: $G = \langle N, \Sigma, P, S \rangle$, $w = a_1 \dots a_n \in \Sigma^*$

Question: $w \in L(G)$?

Procedure:

```
for i := 1 to n do
    N_{i,i} := {A ∈ N | A → a_i ∈ P}
next i
for d := 1 to n − 1 do   % compute N_{i,i+d}
  for i := 1 to n − d do
    j := i + d; N_{i,j} := ∅;
    for k := i to j − 1 do
      N_{i,j} := N_{i,j} ∪ {A ∈ N | there is A → BC ∈ P
                                    with B ∈ N_{i,k}, C ∈ N_{k+1,j}}
    next k
  next i
next d
```

Output: "yes" if $S \in N_{1,n}$, otherwise "no"

The CYK Algorithm II

Example 11

(on the board)

- $G: \quad S \to SA \mid a$
  $A \to BS$
  $B \to BB \mid BS \mid b \mid c$
- $w = abaaba$
- Matrix representation of $N_{i,j}$

Outline

Pushdown Automata I

- **Goal:** introduce an automata model which exactly accepts CFLs
- **Clear:** DFA not sufficient
  (missing "counting capability", e.g. for $\{a^n b^n \mid n \in \mathbb{N}\}$)
- DFA will be extended to pushdown automata by
  - adding a pushdown store which stores symbols from a pushdown alphabet and uses a specific bottom symbol
  - adding push and pop operations to transitions

Pushdown Automata II

Definition 12

A pushdown automaton (PDA) is of the form
$\mathfrak{A} = \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ where

- Q is a finite set of states
- Σ is the (finite) input alphabet
- Γ is the (finite) pushdown alphabet
- $\Delta \subseteq (Q \times \Gamma \times \Sigma_\varepsilon) \times (Q \times \Gamma^*)$ is a finite set of transitions
- $q_0 \in Q$ is the initial state
- Z_0 is the (pushdown) bottom symbol
- $F \subseteq Q$ is a set of final states

Interpretation of $((q, Z, x), (q', \delta)) \in \Delta$: if the PDA $\mathfrak{A}$ is in state q where Z is on top of the stack and x is the next input symbol (or empty), then $\mathfrak{A}$ reads x, replaces Z by δ, and changes into the state q'.

Configurations, Runs, Acceptance

Definition 13

Let $\mathfrak{A} = \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ be a PDA.

- An element of $Q \times \Gamma^* \times \Sigma^*$ is called a configuration of $\mathfrak{A}$.
- The initial configuration for input $w \in \Sigma^*$ is given by (q_0, Z_0, w).
- The set of final configurations is given by $F \times \Gamma^* \times \{\varepsilon\}$.
- If $((q, Z, x), (q', \delta)) \in \Delta$, then $(q, Z\gamma, xw) \vdash (q', \delta\gamma, w)$ for every $\gamma \in \Gamma^*$, $w \in \Sigma^*$.
- $\mathfrak{A}$ accepts $w \in \Sigma^*$ if $(q_0, Z_0, w) \vdash^* (q, \gamma, \varepsilon)$ for some $q \in F$, $\gamma \in \Gamma^*$.
- The language accepted by $\mathfrak{A}$ is $L(\mathfrak{A}) := \{w \in \Sigma^* \mid \mathfrak{A} \text{ accepts } w\}$.
- A language L is called PDA–recognizable if $L = L(\mathfrak{A})$ for some PDA $\mathfrak{A}$.
- Two PDA $\mathfrak{A}_1, \mathfrak{A}_2$ are called equivalent if $L(\mathfrak{A}_1) = L(\mathfrak{A}_2)$.

Examples

Example 14

1. PDA which recognizes $L = \{a^n b^n \mid n \in \mathbb{N}\}$ (on board)
2. PDA which recognizes $L = \{ww^R \mid w \in \{a, b\}^*\}$ (palindromes of even length; on board)

Deterministic PDA

Observation: $\mathfrak{A}_2$ is nondeterministic: in every construction step, the pushdown could also be deconstructed

Deterministic PDA

Observation: $\mathfrak{A}_2$ is nondeterministic: in every construction step, the pushdown could also be deconstructed

Definition 15

A PDA $\mathfrak{A} = \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ is called deterministic (DPDA) if for every $q \in Q, Z \in \Gamma$,

- for every $x \in \Sigma_\varepsilon$, at most one (q, Z, x)–step in Δ and
- if there is a (q, Z, a)–step in Δ for some $a \in \Sigma$, then no (q, Z, ε)–step is possible.

Deterministic PDA

Observation: $\mathfrak{A}_2$ is nondeterministic: in every construction step, the pushdown could also be deconstructed

Definition 15

A PDA $\mathfrak{A} = \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ is called deterministic (DPDA) if for every $q \in Q, Z \in \Gamma$,

- for every $x \in \Sigma_\varepsilon$, at most one (q, Z, x)–step in Δ and
- if there is a (q, Z, a)–step in Δ for some $a \in \Sigma$, then no (q, Z, ε)–step is possible.

One can show: determinism restricts the set of acceptable languages (DPDA–recognizable languages are closed under complement, which is generally not true for PDA–recognizable languages)

Example 16

The set of palindromes of even length is PDA–recognizable, but not DPDA–recognizable.

PDA and Context–Free Languages I

Theorem 17

A language is context–free iff it is PDA–recognizable.

PDA and Context–Free Languages I

Theorem 17

A language is context–free iff it is PDA–recognizable.

Proof.

$\Longleftarrow$ omitted

$\Longrightarrow$ let $G = \langle N, \Sigma, P, S \rangle$ be a CFG. Construction of PDA $\mathfrak{A}_G$ recognizing $L(G)$:

- $\mathfrak{A}_G$ simulates a derivation of G where the leftmost nonterminal of a sentence form is replaced ("leftmost derivation")
- begin with S on pushdown
- if nonterminal on top: apply corresponding production rule
- if terminal on top: match with next input symbol

□

continued.

$\Longrightarrow$ Formally: $\mathfrak{A}_G := \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ is given by

- $Q := \{q_0\}$
- $\Gamma := N \cup \Sigma$
- if $A \to \alpha \in P$, then $((q_0, A, \varepsilon), (q_0, \alpha)) \in \Delta$
- for every $a \in \Sigma$, $((q_0, a, a), (q_0, \varepsilon)) \in \Delta$
- $Z_0 := S$
- $F := Q$

□

continued.

$\Longrightarrow$ Formally: $\mathfrak{A}_G := \langle Q, \Sigma, \Gamma, \Delta, q_0, Z_0, F \rangle$ is given by

- $Q := \{q_0\}$
- $\Gamma := N \cup \Sigma$
- if $A \to \alpha \in P$, then $((q_0, A, \varepsilon), (q_0, \alpha)) \in \Delta$
- for every $a \in \Sigma$, $((q_0, a, a), (q_0, \varepsilon)) \in \Delta$
- $Z_0 := S$
- $F := Q$

□

Example 18

"Bracket language", given by G:

$$S \to () \mid (S) \mid SS$$
